Product Identification Safety and Data Transfer

Automatic Dosing – safe and efficient right from the start

Regardless of the individual steps of automated cleaning and disinfection processes: if the initial step is incorrect – for example due to a wrong detergent – the whole process is in danger. Production times could be prolonged, components and plants could be damaged or – in the worst case – the health of consumers could be at risk. An automated system for product identification eliminates this risk: chemical containers cannot be mixed up and cleaning and disinfection processes can be started with the highest level of safety.

Innovation – proven for practice

Safe handling and secured cleaning processes – this aim was the start for developing such an innovative system as Dr. Weigert is known for its state-of-the-art hygiene solutions. Be it in the food and beverage industry, in the pharmaceutical industry or in other hygiene-sensitive areas such as laboratories and in the reprocessing of medical devices – Dr. Weigert technology stands for an optimum of safety and efficiency which also applies to the new weigomatic identSYSTEM.

Systematic Hygiene – with RFID technology

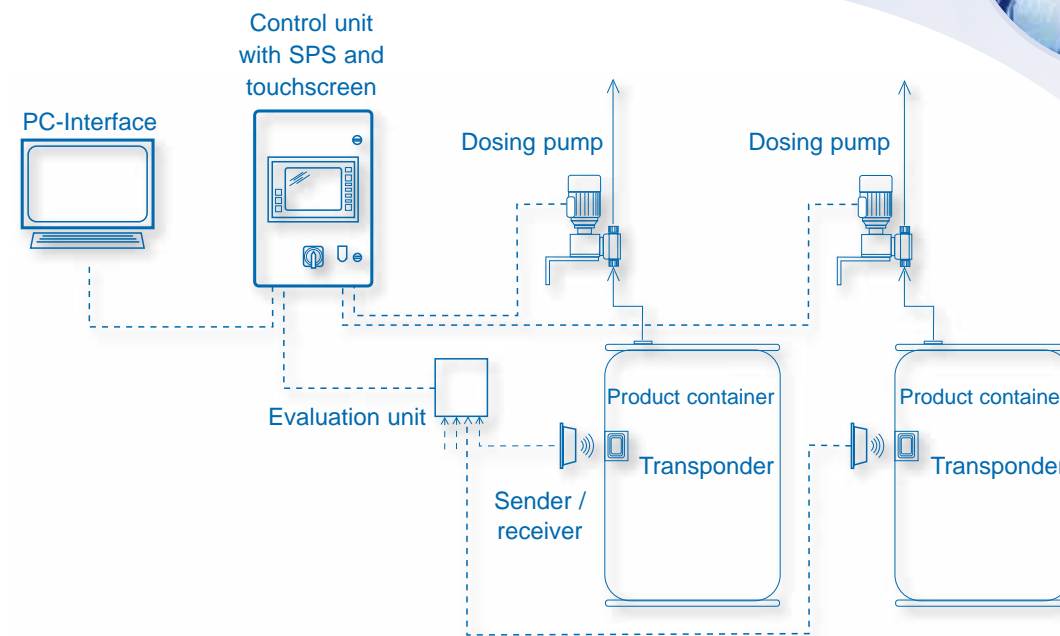

Using RFID technology (Radio Frequency Identification) the functional principle of the system is brilliant as it is simple. Each single container is individually coded with a RFID-tag. This transmitter sends out a signal which is recognised by a receiver at the dosing station.

If the correct code is detected it is guaranteed that the cleaning and disinfection process only operates with the designated detergent or disinfectant. At the same time relevant data is collected and can be monitored such as the exact times of container change and the period of use. Also the lot number and the expiry date of the process chemical are registered.

Take advantage of the innovative weigomatic identSYSTEM-technology.

Automated product identification for safe hygiene-processes :

weigomatic® identSYSTEM

Easy and time-saving

- Automatic product identification
- No manual scanning or data-entry necessary

Safe and economical

- Mix-up of detergent containers is impossible
- Hygiene processes can only be started with designated detergents and disinfectants
- High product quality and value retention of equipment

Consistent quality documentation

- Basis for validated cleaning processes through monitoring of relevant data for quality management
